Task 1 Data sourcing and loading
Data Sourced from the Excel CSV file
ETL-data will be loaded by extracting it, Transforming and loading it into SQL enabled platform DataBricks
Data will be stored in Data bricks in the Catalog and default schema file
The data will be analysed using the SQL Editor and Query platform within the DataBricks software
Task 2 Data processing in Databricks and Excel
Key insight to be analysed
1. Sales volumes by time intervals
2.Sales volumes by product _category/type/detail
3.Sales revenue where product_qty* unit_price
Grouping sales values and volumes by store_location, by Product-category, type and detail
Comparing volumes and revenue across all the stores, working out total revenue across and for each store
Calculation grouped by time intervals , dates, weekly & monthly patterns
Task 3 DataAnalysis in Excel
Export the transformed table from SQL DataBricks into Excel to create pivot table and formate Dashboard
Create a Dashboard on either Excel or in the DataBricks software.
Task 4 Presentation to the CEO
Place the Excel graphs on the Powerpoint presentation or Canva.
Share the Dashboard with the CEO and support staff for daily use to monitor the performances of sales volumes ad sales values.
Placing the graphs according to objectives unswering the challenges that the CEO is facing
Make recommendation to the CEO and sales team on marketing strategies to improve sales and attract new customers
Presentation to CEO and his staff
